

Lakeshore Enterprise Finance & Treasury Modernization: Kyriba Rollout, Corporate Controls, Reporting Rationalization, Vendor Optimization & Value Realization

Lakeshore Enterprise Finance & Treasury Modernization: Kyriba Rollout, Corporate Controls, Reporting Rationalization, Vendor Optimization & Value Realization

- The board-grade Estimate & Financial Model produced by the Moves Expert Kernel for this Move. Every figure is the kernel's — the effort estimate is a planning range on a researched benchmark rate card, NOT a quote; the value forecast rests on curated benchmark proxies; unrecorded inputs are named seed gaps; and the verdict is the kernel's real recommendation, never invented.

KILL — the estimate does not support funding.

- Base-case net return is not positive — the Move does not pay back on current assumptions.

The financial model is built on 4 recorded metrics — 8 declared seed gaps are the honest limits of what the model can claim today.

- The financial model is built on 4 recorded metrics and 8 declared seed gaps — baseline coverage 33%. Every recorded input carries a source, an as-of date and a confidence; every missing input is a precise seed gap inherited from the curated Function Pack — never left blank, never guessed.
- The recorded metrics ground the cost and value model. The seed gaps are declared in-line — the honest limits of what the estimate can claim today.

Input metric	Value	Source
Cost of funds	4.6 percent (blended)	Debt & FX exposure (treasury_kyriba)
Return on equity (ROE)	11.8 percent (EBITDA margin proxy)	Revenue & cost baseline (finance_performance)
Financial-forecast accuracy	78 percent (forecast vs actual)	FP&A reconciliation (Lakeshore enterprise context load V
Planning and close cycle time	8.5 business days to close	Month-end close baseline (operations_business_process)
Net interest margin (NIM) Seed gap	Not recorded	"Net interest margin (NIM)" is not recorded — this

Net stable funding ratio (NSFR) Seed gap	Not recorded	"Net stable funding ratio (NSFR)" is not recorded
Expected data source — The liquidity-risk and regulatory-rep		
Economic-value-of-equity rate sensitivity Seed gap	Not recorded	"Economic-value-of-equity rate sensitivity" is not
Expected data source — The ALM system, running the EVE measu		
Net-interest-income rate sensitivity Seed gap	Not recorded	"Net-interest-income rate sensitivity" is not reco

All 8 workstreams are costed individually — the estimate is never collapsed into a generic six-role model.

- The estimate decomposes into all 8 Move workstreams — AI build, integration, data, foundational, data governance, process redesign, change & adoption and run. Each is costed on its own role mix; none is collapsed into a generic six-role model. Every figure is a planning estimate, NOT a quote.
- Business change is 24% of base effort — the outlined bars. Omitting it is the common way an AI estimate fails; here it is a first-class, costed lane.
- AI Ops cost is not supplied on this Move yet. The funding view is still honest: build and change cost are shown, and the run-cost gap remains visible instead of being implied.
- The base / conservative / upside columns are a planning range derived from the curated Function Pack archetypes — they must be replaced with a client-specific estimate before any funding commitment.

Workstream	Upside	Base	Conservative	Human	AI agent	FTEs	Duration
AI build	\$1.88M	\$2.21M	\$3.09M	\$1.44M	\$773K	7	9 mo
Integration	\$659K	\$776K	\$1.09M	\$621K	\$155K	4	6 mo
Data	\$608K	\$716K	\$1.00M	\$501K	\$215K	4.5	5 mo
Foundational	\$138K	\$163K	\$228K	\$138K	\$24K	1	4 mo
Data governance Business change	\$338K	\$397K	\$556K	\$357K	\$40K	2	6 mo
Process redesign Business change	\$419K	\$493K	\$690K	\$444K	\$49K	3	5 mo
Change & adoption Business change	\$516K	\$607K	\$850K	\$577K	\$30K	2	9 mo
Run (year-1 operations)	\$642K	\$756K	\$1.06M	\$454K	\$302K	2	12 mo
Total — 8 workstreams	\$5.20M	\$6.12M	\$8.56M				

Every rate traces to a named source — the estimate runs on a researched benchmark rate card, labelled NOT a quote.

- Every rate in this estimate traces to a named source. The model runs on the kernel's researched benchmark rate card — not a hidden rate. The rate-card source is shown below, and the client-override path is explicit.
- Each role family keeps its onshore and offshore lane distinct — domain, location and seniority are not collapsed into one blended rate. A priced lane shows its rate; an unpriced lane is hatched.

Attribute	Value
Provenance	researched_benchmark
Client override in effect	No — researched benchmark default
Effective AI-agent split	26% of base effort delivered by AI agents
Source label	Researched benchmark rate card — fully-loaded annual rates d

Value is a planning range built on curated benchmark proxies — the kernel honestly blocks a claimable dollar payback.

- Net 3-year value is carried as a planning range — point \$113, range \$61 to \$165. It rests on the Function Pack's curated benchmark proxies, so the kernel honestly blocks a claimable dollar payback until the tenant's own metrics land.

- The gross figure is the upper planning bound — a curated benchmark proxy, not the tenant's own measured value. The net is directional, not a verified return.
- The adoption ramp is a conservative planning curve — value lands as people change how they work, never on day one. It is a planning curve, not a commitment.

Year	Adoption	Net value at adoption
Year 1	30%	\$34
Year 2	65%	\$74
Year 3	85%	\$96

The case is shown as three scenarios, never one point — and because monetisation is blocked the cash-flow curve is a net-value model, not a payback claim.

- A single ROI number would hide the real shape of the case. This estimate is shown as three scenarios — conservative, base, upside — and the assumptions that move it most are ranked. The cash-flow curve is staged across the cost lanes — and because monetisation rests on a curated proxy it models discounted net value, not verified cash.
- A hatched bar is a seed-gap proxy — an assumption that rests on a gap, not recorded data. It is the widest mover for a reason.
- The lines are cumulative discounted net value, not cash — they are staged across the build, change and run cost lanes.
