

ERP Landscape & S/4HANA Migration

SAP estate, technical debt, and brownfield migration approach.

Owner: Priya Natarajan · Source system: SAP · As of: 2026-06-06 · Sensitivity: Internal

Production instances

Lakeshore operates a federated SAP estate: two ECC 6.0 instances (NA, EMEA) on Oracle DB, one S/4HANA 2022 instance (APAC) on HANA, and a legacy ECC instance (LATAM). Consolidation to a single S/4HANA tenant is the FY26-27 ERP north star.

Instance	Region	Version	DB	Modules	Migration	Interfaces
PRD-NA	North America	ECC 6.0	Oracle 19c	FI/CO/MM/SD/PP	Wave 2 FY26 (brownfield)	98
PRD-EU	EMEA	ECC 6.0	Oracle 19c	FI/CO/MM/SD	Wave 2 FY26 (brownfield)	74
PRD-AP	APAC	S/4HANA 2022	HANA 2.0	Finance/Sourcing	Live (selective data transition)	41
PRD-LA	LATAM	ECC 6.0	Oracle 12c	FI/MM	Wave 3 FY27	27

Integration & data flows

ERP integrates outbound via IDoc (PEXR2002 payments to Kyriba, INVOIC, ORDERS) and OData/BAPI for real-time lookups; inbound master data via ALE distribution. Financial actuals flow nightly to Snowflake via IDoc→Parquet landing, then dbt curation. Payment proposals flow hourly to Kyriba over the ESB.

- Outbound: IDoc (payments, invoices), OData (real-time), ALE (master data)
- Inbound: bank statements via Kyriba→ERP recon postings
- Batch: GL/AP/AR nightly extract → Snowflake bronze
- Clean-core principle for S/4: extensions on BTP, no core mods

Technical debt & risks

- ECC mainstream maintenance end-of-life pressure; 1,400+ custom Z-objects to remediate.
- Inconsistent chart-of-accounts across instances complicates consolidation.
- Interface sprawl (240+) raises migration regression risk — see integration architecture.
